

MARKETPILOT

Navigate uncertainty before you launch.

We turn probabilistic market forecasts into transparent go / no-go decisions — for the people betting capital on an idea.

Zero One Hack · Vienna · May 2026 | Track: Forecasting AI (Sybillion)

THE PROBLEM

A forecast is not a decision.

Founders and the investors who back them face the same go / no-go call — and answer it on gut feel. Forecasting tools hand over a number and a list of drivers, but that, by itself, changes nothing.

Will it work — here, right now?

No defensible answer before capital is committed.

Uncertainty stays hidden

Wide confidence bands are exactly what tells you when NOT to act — yet tools bury them.

Numbers $\neq$ action

A prediction plus a driver list is not a recommendation a non-expert can act on.

The bottleneck isn't prediction accuracy — it's **translating a probabilistic forecast into action that respects uncertainty.**

OUR SOLUTION

Type an idea. Get a go / no-go you can defend.

MarketPilot is a decision agent on top of a probabilistic forecast. Describe a business in plain language; we surface what matters and return one of four clear verdicts — each with the numbers and reasoning behind it.

"I want to open an ice cream shop in Vienna's 1st district."

The verdict is derived, not declared — change an input and it moves, live.

Launch

Attractive under current assumptions.

Adapt concept

Real potential — adjust the model.

Delay / relocate

Not under these conditions or here.

Do not launch

Not viable as it stands.

Deterministic math

Revenue, costs, break-even and the verdict come from traceable Python — not an LLM guessing.

Visible reasoning

Every call ships with its drivers, break-even probability and a plain-language why.

Adapts mid-run

Shift an assumption and the recommendation updates in real time.

Same engine, two sides of one decision.

The numbers and reasoning are identical; only the question changes. That makes MarketPilot a tool for the asker and the underwriter alike.

Founders

VALIDATE BEFORE CAPITAL

Is the demand there, is the location right, where's break-even, and what would make it viable?

Investors

INVESTMENT RISK EVALUATION

An independent second opinion on a pitch — grounded in a demand forecast, explicit downside/upside, and a real break-even probability.

Banks & lenders

LOAN & CREDIT EVALUATION

Assess a location-based venture before financing it, with a traceable verdict and driver analysis that attaches to the credit file.

Why now: decision intelligence is the underserved layer above Europe's forecasting infrastructure — independent of any single model or API.

TECHNICAL ARCHITECTURE

Forecast in. Deterministic decision out.

Six stages. The LLM structures the input and explains the result; every number and the verdict are computed by deterministic Python — reproducible and auditable.

Step 5 is the moat

FastAPI · Python

React 19 · TanStack

Sybillion SDK

Featherless LLM

Tailwind · shadcn/ui

Watch the verdict move when reality does.

Ice cream shop · Vienna, 1st district

1

Analyze

Forecast with confidence bands, driver importance, break-even probability — verdict: Adapt concept.

2

Shift an assumption — live

The jury raises monthly rent €8k → €13k.

3

The agent reacts

Break-even probability drops; verdict moves to Do not launch / relocate.

4

Improve the concept

Raise basket size, add tastings → verdict recovers to Adapt / Launch.

MARKETPILOT

We turn probabilistic forecasts into go / no-go decisions you can defend.

Built for founders, investors, and lenders — independent decision intelligence on top of European forecasting infrastructure.

Wire the deterministic model end-to-end

Plug in real data sources (Eurostat, ...)

Multi-location & multi-vertical
